Allograft Tissue Graft

Pre-op

Generalized Recession with a band of keratinized/attached gingiva.

Excellent interproximal bone and soft tissue heights. Free gingival graft previously completed on #23-24 (lower front teeth). An allograft was used; no patient donor site needed.

12 week post-op

Excellent root coverage and gingival contours between all teeth (no black triangles).

An allograft tissue graft is excellent for generalized recession since tissue quantity is unlimited. Although the superficial tissue characteristics do not change, resilient and attached tissue is created to achieve root coverage.
